

Ghost Predator — Weekly + Weekend Audit

Live data, June 8–15 2026. Segmented at the sweet-spot window deploy (June 11, 13:05 UTC). Every number from the trade DB / 1-second tape. No estimates.

1 · Headline — the window change worked

Segment	Trades	Win rate	PnL	EV / trade
NEW window (7-14s)	74	66.2%	+\$45.32	+\$0.612
OLD window (T-29)	287	68.6%	-\$57.21	-\$0.199
Weekend (Fri-Sun)	65	63.1%	+\$9.50	+\$0.146
Last 7 days (all)	361	68.1%	-\$11.89	-\$0.033

The single most important number: the fire-window change flipped per-trade EV from **-\$0.20 to +\$0.61** — a 3x swing and a sign flip. The old T-29 bot bled -\$57 over 287 trades; the new 7-14s bot made +\$45 over 74. Note WR is similar (~67% vs ~69%) — the gain is NOT from winning more often, it's from **not holding through the reversal seconds** and from better entry prices. The weekend was net **positive (+\$9.50)** despite feeling brutal; cash went \$268→\$298 (+\$30).

Per day (UTC): Fri +\$4.49 · Sat +\$28.01 · Sun -\$23.00 · Mon -\$10 (early). One red day in four.

2 · Why we WIN

The edge concentrates in clear, repeatable places:

Cut	Best cell	Worst cell
Ask band	0.70-0.75: 82.6% WR, +\$42.66	0.50-0.60: 48.3% WR, -\$25.19
Fire timing	T-12 to 14s: 69.8% WR, +\$59.65	T-7 to 11s: weaker (small n)
Duration	5m: 66.2% WR, +\$50.91	15m: barely traded (n=3)
Coin	ETH 72.7% / BTC 63.5%	(both net positive)

The cleanest signal in the whole book: ask price. Higher ask = the crowd agrees with the lead = the lead sticks. 0.70-0.75 entries win 83%; 0.50-0.60 entries are a 48% coin flip. Fire timing confirms the sweet spot — T-12 to 14s carries the entire profit; firing later (closer to close) is weaker on this sample. Lead-size buckets are NON-monotonic noise (1.5-2bps is the most profitable bucket at +\$71) — re-confirming that raising the bps bar does not work.

3 · Why we LOSE

Pattern	n	Win rate	PnL
Cheap ask + thin lead (ask<0.62 & lead<2.5)	21	47.6%	-\$21.09
Everything else	53	73.6%	+\$66.41

The losses are not random — they cluster in the **cheap-ask coin flip** (a thin lead the crowd prices below 0.62 is a genuine 50/50) and in the **overnight UTC chop hours** (00:00 / 04:00 / 20:00 blocks all bled; midday 12:00 / 16:00 blocks crushed it at +\$93 / +\$39). Confirmed from last week's anatomy: every loss is a reversal of a real lead, and losses remain statistically hard to separate from wins on lead size alone — the separator that DOES exist is ask price.

4 · Fixes — what actually survives

(a) The ask<0.60 skip is now the strongest candidate — but it's a real trade-off, not free. On the clean new-window data, skipping ask<0.60 trades nets **+\$25.19** (avoids -\$180 of losses, gives up +\$155 of winners). The cheap asks run 48% WR — below breakeven for their price. BUT: those same cheap asks produced the +\$10-12 fat-tail payouts you watched win live. Deploying this trades the fat tails for fewer losses. It is now genuinely worth

considering — recommend a final adversarial check (drop the single biggest cheap winner; re-test) before any deploy. Closer to a yes than it was, still not automatic.

(b) Depth gate \$100 confirmed AGAIN. The \$50-100 book bucket (what a \$50 gate takes and your \$100 gate blocks): 62.1% WR, **-\$74.05**. Your kept set (\$100+): 68.2% WR, **+\$102.20**. The gate is doing heavy lifting — do not lower it. (Worth telling Marc: if he runs <\$100, this bucket is bleeding him.)

(c) 15m duration is dead weight. Only 3 trades, **-\$5.59**. The bot barely qualifies 15m markets now — not worth a config change, just noting it contributes nothing.

(d) Scratch fix VALIDATED. First post-fix breach (#851) unwound for **-\$0.89** vs the \$10 the old code would have held. Breaches are now ~\$1 events.

5 · What I learned this week

1. The fire-timing change is the real edge — same win rate, triple the EV, by refusing the reversal seconds. 2. Ask price is the one feature that separates wins from losses; lead size does not. 3. "It's the chop" was over-stated — quiet tape is fine; the damage is specifically cheap-ask coin flips in low-liquidity overnight hours. 4. You cannot backtest across a config change — the old T-29 era (-\$57) contaminates any all-data sweep. 5. Holding through the Sunday drawdown beat pausing — floor never breached, recovered to **+\$30** on the weekend.

Bottom line: the bot is working as designed (**+\$0.61/trade** on the current config). The one lever worth a real decision is the ask<0.60 skip — now showing **+\$25** on clean data but at the cost of the big cheap-ask payouts. Everything else: keep riding, the edge is intact.

Ghost In the System — internal. No keys, wallets, or endpoints. Generated live before PC disconnect, June 15.
